

Abstract

This invention relates to setting time on one or more clocks using a remote controller, one at a time. The remote controller synchronizes all the clocks to the same time. The same remote controller can also be used to set alarm on the clocks. The alarm can be set to the same time on all clocks or to a different time on each of the clocks. The clocks referred here contain necessary circuitry to receive the signals from the remote controller to set time or alarm automatically.
